

Finals Lab Task 3. MySQL Basics

Multi-Level Company Database

The following are the tasks that need to be implemented using MySQL statements. Make sure to complete them in the order specified:

- **Task 1:** Create a table named `employees` with the following fields:
 - `employee_id`: Unique integer, auto-increment, primary key.
 - `employee_name`: String (VARCHAR) with up to 255 characters, not null.
 - `manager_id`: Integer, foreign key referencing `employee_id` in the same table (`employees`).
- **Task 2:** Create a table named `departments` with the following fields:
 - `department_id`: Unique integer, auto-increment, primary key.
 - `department_name`: String (VARCHAR) with up to 255 characters, not null.
- **Task 3:** Create a table named `employee_departments` with the following fields:
 - `employee_id`: Integer, foreign key referencing `employee_id` in `employees`.
 - `department_id`: Integer, foreign key referencing `department_id` in `departments`.
 - Composite primary key (`employee_id`, `department_id`).
- **Task 4:** Create a table named `employee_projects` with the following fields:
 - `employee_id`: Integer, foreign key referencing `employee_id` in `employees`.
 - `project_name`: String (VARCHAR) with up to 255 characters, not null.
- **Task 5:** Create a table named `managers` with the following fields:
 - `manager_id`: Unique integer, auto-increment, primary key.
 - `employee_id`: Integer, foreign key referencing `employee_id` in `employees`.

Required output to be submitted

1. SQL statements for (Task 1-5)
2. Table Structure (Employees, departments, employee_dept, employee_projects and managers)
3. Relational schema from the EER model of Mysql Workbench (pdf or jpg file)
4. Sql copy of the database and table structures (export the database into an sql file **Note: Make sure to install xampp and Mysql Workbench before working on this task**)
